Motivation

- Evaluate the performance based on:
 - Number of Nodes
 - Transmission Power
 - Source Data Rate
 - Environment Size
- Compare the performance of three different routing protocols

García Villalba, L.J.; García Matesanz, J.; Sandoval Orozco, A.L.; Márquez Díaz, J.D. Auto-Configuration Protocols in Mobile Ad Hoc Networks. Sensors 2011, 11, 3652-3666.

DSR Protocol

- Dynamic Source Routing is a protocol for wireless mesh networks
- An on-demand protocol designed to restrict bandwidth consumed
- Based on source routing

Advantages

Eliminates the need to periodically flood the network with table update messages

Eliminates the need to find routes to all other nodes in the network

Reduces the control overhead by utilizing the route cache information

Disadvantages

The route maintenance mechanism does not locally repair a broken link

Might result in inconsistencies during the route reconstruction

The performance degrades rapidly with increasing mobility

AODV Protocol

- Ad hoc On-Demand Distance Vector Routing is a routing protocol for mobile ad hoc networks and other wireless ad hoc networks
- Used in ZigBee

Advantages	Disadvantages
Can respond very quickly to the topological changes that affect the active routers	Has a high processing demand
Support both unicast and multicast packet transmission	Consumes a large share of the bandwidth
Lower setup delay for connections and detection of the latest route to the destination	Take a long time to build the routing table

TORA Protocol

- The Temporally Ordered Routing Algorithm is an algorithm for routing data across Wireless Mesh Networks or Mobile ad hoc networks
- Limit control message propagation in the highly dynamic mobile computing environment

Advantages

Create a DAG only when necessary

Multiple paths created

Good in dense networks

Disadvantages

Periodic beaconing leads to unnecessary bandwidth consumption

Not scalable by any means

High processing demand

Scenarios Setup

- Comparison of the performance of the three routing protocols based on varying parameters using Riverbed Modeler.

Simulation time	1 Hour
Bandwidth	2 Mb
Traffic type	FTP
Packet size	512
Number of nodes	10, 25 and 50 nodes
Transmission power	0.005 W, 0.03 W, and 0.05 W
Source data rate	1 Mbps, 2 Mbps and 5.5 Mbps
Environment size	10×10, 10×15 and 10×20

- Scenarios are:
 1. Performance (Throughput) based on number of nodes
 2. Performance (Throughput) based on transmission power
 3. Performance (Throughput) based on source data rate
 4. Performance (Throughput) based on environment size

50-node AODV Network Example

Attributes of 'wlan_wkstn_adv' sites

Scenario 1: Performance (Throughput) based on Number of Nodes

AODV: 10 vs 25 vs 50 nodes

DSR: 10 vs 25 vs 50 nodes

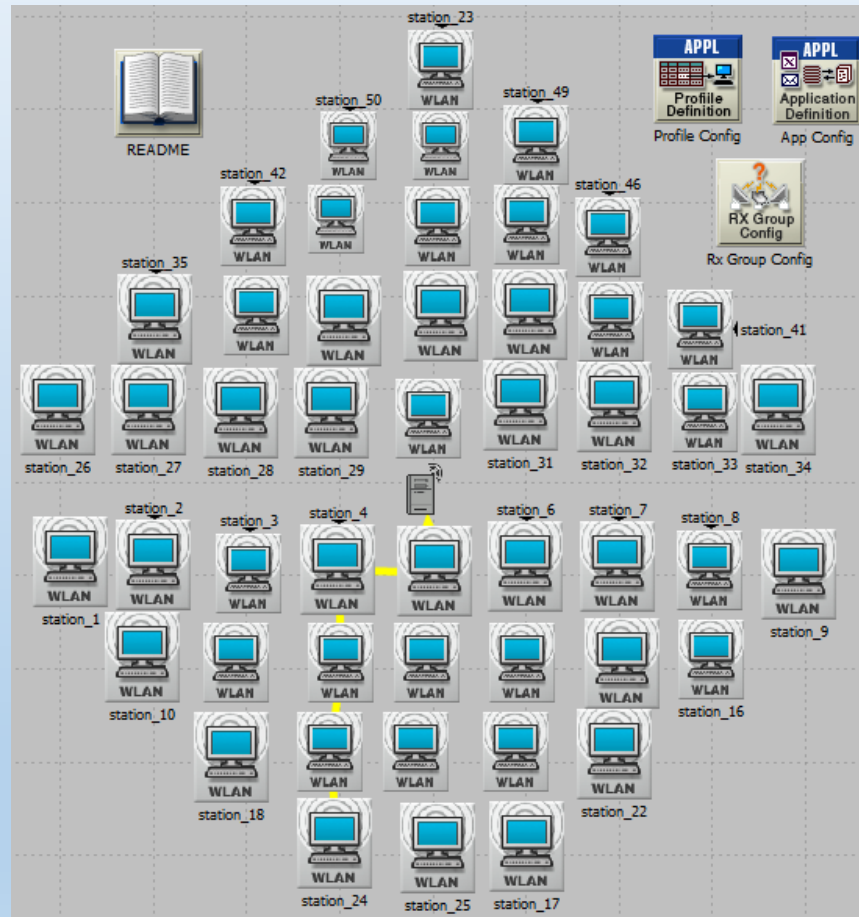

TORA: 10 vs 25 vs 50 nodes

Result: Throughput is increasing as the number of nodes increases for all protocols. AODV has the largest throughput for any number of nodes situations. Both DSR and TORA performs quite similar increase trend in this scenario

50-node DSR network with 0.005 W Example

Attributes of 'wlan_wkstrn_adv' sites

	name	AD-HOC Routing Protocol	AODV Parameters	ARP Parameters	Adaptive Service Configuration	Application: Destination P
1	station_1	DSR	Default	Default	Not Configured	None
2	station_2	DSR	Default	Default	Not Configured	None
3	station_3	DSR	Default	Default	Not Configured	None
4	station_4	DSR	Default	Default	Not Configured	None
5	station_5	DSR	Default	Default	Not Configured	None
6	station_6	DSR	Default	Default	Not Configured	None
7	station_7	DSR	Default	Default	Not Configured	None
8	station_8	DSR	Default	Default	Not Configured	None
9	station_9	DSR	Default	Default	Not Configured	None
10	station_10	DSR	Default	Default	Not Configured	None
11	station_11	DSR	Default	Default	Not Configured	None
12	station_12	DSR	Default	Default	Not Configured	None
13	station_13	DSR	Default	Default	Not Configured	None
14	station_14	DSR	Default	Default	Not Configured	None
15	station_15	DSR	Default	Default	Not Configured	None
16	station_16	DSR	Default	Default	Not Configured	None
17	station_17	DSR	Default	Default	Not Configured	None
18	station_18	DSR	Default	Default	Not Configured	None
19	station_19	DSR	Default	Default	Not Configured	None
20	station_20	DSR	Default	Default	Not Configured	None
21	station_21	DSR	Default	Default	Not Configured	None

Scenario 2: Performance (Throughput) based on Transmission Power

AODV: 0.005 vs 0.03 vs 0.05 W

DSR: 0.005 vs 0.03 vs 0.05 W

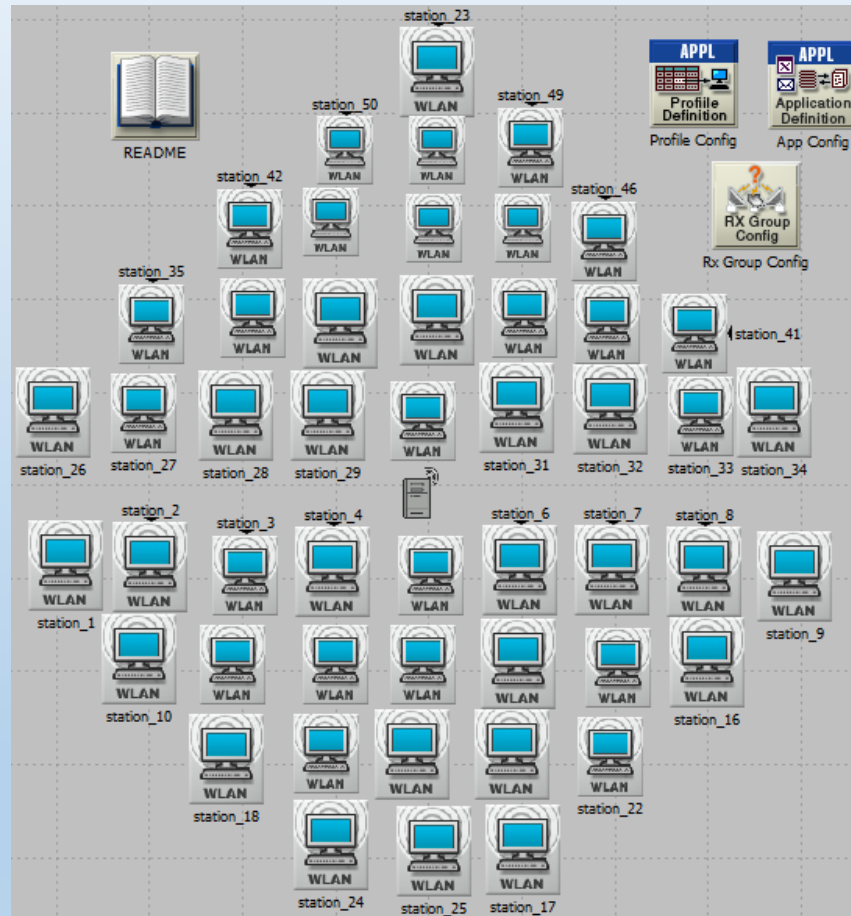

TORA: 0.005 vs 0.03 vs 0.05 W

Result: Throughput is slightly increasing as the transmission power increases for all protocols. AODV performs the largest rise in throughput with the increase of transmission power. But, DSR and TORA don't show significant growth.

50-node TORA network with 1 Mbps Example

Attributes of 'wlan_wkstn_adv' sites

	name	AD-HOC Routing Protocol	AODV Parameters	ARP Parameters	Adaptive Service Configuration	Application: Destination P
1	station_1	TORA	Default	Default	Not Configured	None
2	station_2	TORA	Default	Default	Not Configured	None
3	station_3	TORA	Default	Default	Not Configured	None
4	station_4	TORA	Default	Default	Not Configured	None
5	station_5	TORA	Default	Default	Not Configured	None
6	station_6	TORA	Default	Default	Not Configured	None
7	station_7	TORA	Default	Default	Not Configured	None
8	station_8	TORA	Default	Default	Not Configured	None
9	station_9	TORA	Default	Default	Not Configured	None
10	station_10	TORA	Default	Default	Not Configured	None
11	station_11	TORA	Default	Default	Not Configured	None
12	station_12	TORA	Default	Default	Not Configured	None
13	station_13	TORA	Default	Default	Not Configured	None
14	station_14	TORA	Default	Default	Not Configured	None
15	station_15	TORA	Default	Default	Not Configured	None
16	station_16	TORA	Default	Default	Not Configured	None
17	station_17	TORA	Default	Default	Not Configured	None
18	station_18	TORA	Default	Default	Not Configured	None
19	station_19	TORA	Default	Default	Not Configured	None
20	station_20	TORA	Default	Default	Not Configured	None
21	station_21	TORA	Default	Default	Not Configured	None

☐ Copy and Paste Mode

Scenario 3: Performance (Throughput) based on Source Data Rate

AODV: 1 vs 2 vs 5.5 Mbps

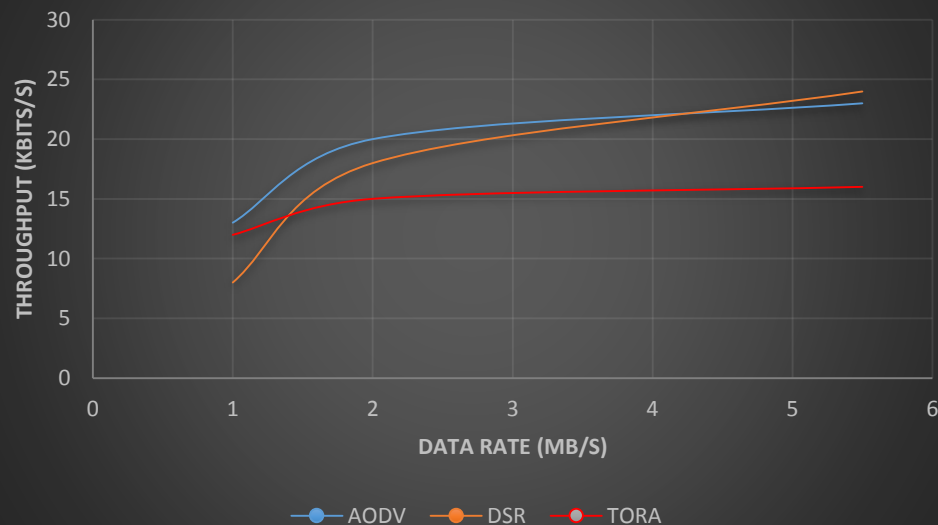

DSR: 1 vs 2 vs 5.5 Mbps

TORA: 1 vs 2 vs 5.5 Mbps

Throughput vs Data Rate

Result: Increase in the source data rate causes an increase in throughput for all protocols. DSR shows the maximum growth in throughput with the increase of source data rate. But, TORA doesn't perform significant increase.

50-node DSR network with different environment sizes

Scenario 4: Performance (Throughput) based on Environment Size

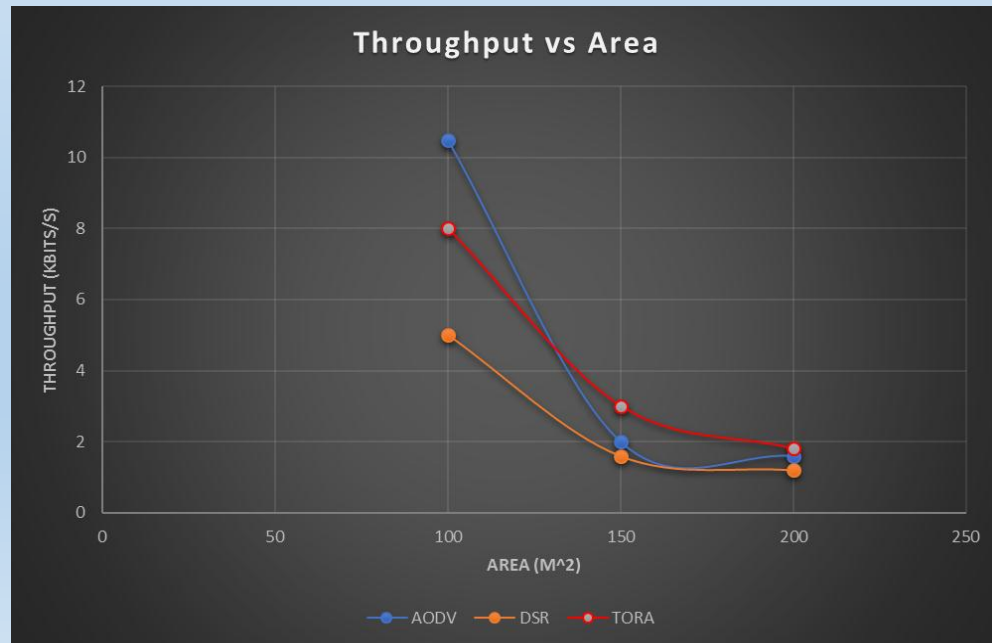

AODV: 10 × 10 vs 10 × 15 vs 10 × 20

DSR: 10 × 10 vs 10 × 15 vs 10 × 20

TORA: 10 × 10 vs 10 × 15 vs 10 × 20

Result: Increasing environment size results in a decrease in throughput. But, AODV has the maximum decline in throughput with the increase of environment size. Besides, both DSR and TORA perform similar downtrend.

Conclusion

- In general, these three protocols perform quite similar behaviors with the four scenarios.
- Among three protocols, AODV shows the best performance especially in varying number of nodes and transmission power scenarios.

Scenarios	Protocols		
	AODV	DSR	TORA
Number of nodes	1	3	2
Transmission power	1	3	2
Data rate	1	2	3
Environmental size	1	3	2

Future Work

- Further investigation in adding more dynamic scenarios such as varying the source data rate with time and varying the speed of mobile nodes.
- Further investigation in adding more performance metrics such as packet delivery ratio and end-to-end delay.
- Further investigation in optimization of one of the three protocols like AODV by controlling the broadcasting of RREQ information.
